

# Guide: Installing and Configuring a Honeypot with PentBox on Kali Linux

This guide will walk you through the process of installing and configuring a basic honeypot using **PentBox** on **Kali Linux**. A honeypot is a security mechanism that lures attackers by simulating vulnerabilities. PentBox is a lightweight security tool used to set up various security scenarios, including honeypots, which can help detect potential intrusions in an enterprise network.

---

## Table of Contents

1. **Introduction to Honeypots**

    - Step 4: Running the Honeypot
    - Step 5: Monitoring the Honeypot
  5. **Verifying Honeypot Activity**
  6. **Analyzing Logs**
  7. **Conclusion**
- 

## 1. Introduction to Honeypots

A **honeypot** is a decoy system or resource that is deliberately made vulnerable to entice cyber attackers. By monitoring the interactions with a honeypot, administrators can detect unauthorized access attempts and gather intelligence about attack methods. This information can be useful for strengthening your enterprise network security.

---

## 2. What is PentBox?

**PentBox** is a security suite written in Ruby that offers various tools for network analysis and penetration testing. One of its most useful features is the ability to create a simple **honeypot** to detect network intrusions. While PentBox is not as advanced as some other honeypot solutions, it is easy to install and configure, making it ideal for lightweight honeypot implementations.

---

## 3. Prerequisites

Before you begin, ensure the following:

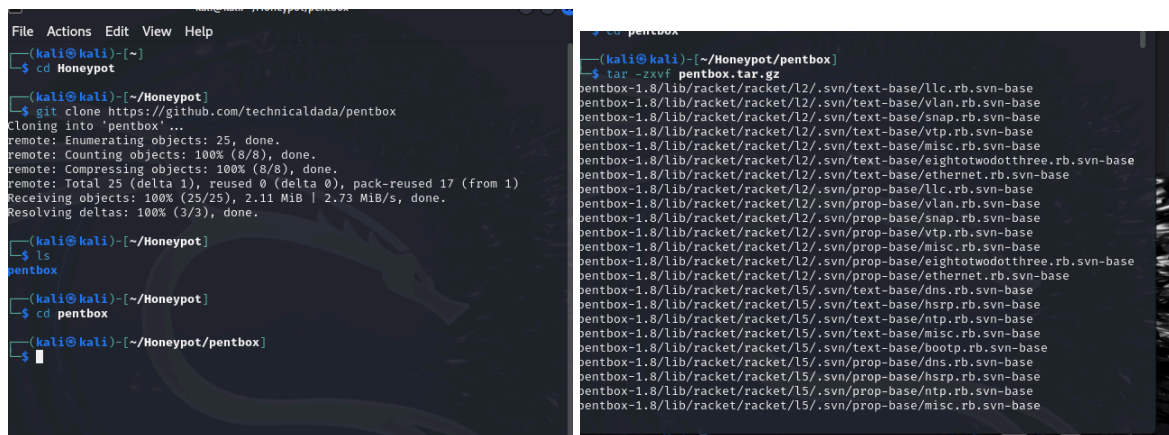

- You have **Kali Linux** installed on your system.
- You have **root access** or appropriate privileges to install software.
- **Ruby** is installed on your Kali Linux (it comes pre-installed on most Kali versions).
- Basic understanding of networking and Linux commands.

---

## 4. Step-by-Step Guide: Installing and Configuring PentBox Honeypot

### Step 1: Update Your Kali Linux

Before installing PentBox, it's a good practice to update the system to ensure that you are running the latest packages. `sudo apt update && sudo apt upgrade -y`

```
(kali@kali)~$ cd Honeypot
(kali@kali)~/Honeypot$ git clone https://github.com/technicaldada/pentbox
Cloning into 'pentbox'...

```

### Step 2: Install PentBox on Kali Linux

You can download PentBox directly from GitHub or clone it to your system using the following command:

git clone <https://github.com/technicaldada/pentbox.git>

cd pentbox

select the Fast Auto Configuration option, on the run Pentbox screen, type:

1

```
0- Back
    → 3

// Honeypot //

You must run PentBox with root privileges.

Select option.

1- Fast Auto Configuration
2- Manual Configuration [Advanced Users, more options]

    → 1

HONEYPOT ACTIVATED ON PORT 80 (2024-10-08 16:19:45 -0400)
```

The next screen will ask you to configure the port you want the honeypot to listen on. Common ports targeted by attackers include 22 (SSH), 23 (Telnet), or 80 (HTTP).

You will get a notification that the HONEYPOT ACTIVATED ON PORT 80.

```
// Honeypot //

You must run PentBox with root privileges.

Select option.

1- Fast Auto Configuration
2- Manual Configuration [Advanced Users, more options]

    → 1

HONEYPOT ACTIVATED ON PORT 80 (2024-10-08 16:19:45 -0400)
```

```

$
```

Test Honeypot Fast Auto Configuration Functionality with a new Kali Linux tab: ifconfig

Open Firefox on the Kali Linux machine, click on the address bar, and type: which will be different for each, mine is 10.0.2.15 then enter. An “Access denied” message appears on the web page.

The Kali terminal window displays INTRUSION ATTEMPT DETECTED from 10.0.2.15:50061.

Note that the port numbers may vary.

In a real scenario, the system administrator where the honeypot is deployed can take the appropriate measures to strengthen a computer system's defenses.

```
